ABSTRACT

SkillSProf is a Flutter mobile platform enabling students to teach and learn skills from peers. Features include onboarding, authentication, dashboard with categories, skill discovery, course enrollment, messaging, payment integration, profile management, and content upload. Built with Firebase microservices architecture and implementing clean architecture patterns (Repository, Singleton, Factory, Observer), the platform ensures scalable, maintainable peer learning.

CHAPTER 1: INTRODUCTION

1.1 Overview

SkillProf connects student educators with learners through a mobile platform featuring skill categories (Learn Skills, Teach Skills), course discovery with ratings, payment integration (MTN/Orange Money), real-time messaging, and content management. The platform includes 25+ screens covering onboarding, authentication, learning, teaching, communication, and transactions.

1.2 Problem Statement

Students face expensive courses, unverified teachers, limited payment options, and poor communication tools. SkillProf addresses these through skill categorization, integrated payments, real-time chat, and rating systems.

1.3 Objectives

1. **Skill Discovery:** Category-based browsing (Learn/Teach Skills)
2. **Course Management:** Upload lessons (PDF/Video), set pricing
3. **Payments:** Mobile money integration (MTN, Orange)
4. **Communication:** Real-time inbox messaging
5. **Quality:** Rating/review system, blog discovery

1.4 Platform Purpose

SkillProf serves as a bridge between student educators and learners, democratizing access to quality education while creating economic opportunities for skilled students. By maintaining rigorous verification standards and quality controls, the platform builds trust within the learning community and ensures sustainable, high-quality educational experiences.

1.5 Key Features

- **Onboarding:** 3 welcome screens with skip/next navigation
- **Authentication:** Sign up (student/tutor), sign in, password recovery, verification codes
- **Dashboard:** Categories (Learn/Teach), trending offers, recommendations, filters
- **Discovery:** Search with voice input, category filtering, skill cards with pricing/ratings
- **Courses:** Detailed views with outlines, pricing (100,000fr - 150,000fr), "Pay to learn" button
- **Payments:** MTN/Orange Money selection, checkout with tax calculation
- **Messaging:** Inbox with search, personal conversations with timestamps
- **Profile:** Edit profile, payment methods, language, order history, help center
- **Content Upload:** PDF/Video upload, gallery/folder selection, post completion
- **Notifications:** Settings for payments, sounds, vibrate, offers, cashback, promos
- **Blogs:** Discovery dashboard with featured articles, categories

1.6 Innovations:

1. **AI-Powered Verification:** Unlike traditional platforms that rely solely on credential uploads, SkillProf incorporates AI-generated examinations that assess practical knowledge and competency, providing an accessible alternative for users without formal certifications.
2. **Trust-Based Architecture:** The platform's verification requirements create a trusted ecosystem where learners can confidently invest time and resources knowing instructors have demonstrated genuine expertise.
3. **Community-Driven Quality:** The integrated rating system creates a self-regulating marketplace where quality naturally rises to prominence and poor performers are identified and addressed.
4. **Microservices Flexibility:** The backend architecture separates concerns into distinct services (Auth, User, Verification, Lesson, Messaging, Rating, Notification), enabling independent scaling and maintenance of critical platform functions.

1.7 Target Audience

Primary: Students (18-30 years) seeking affordable skills or monetization
Secondary: Tutors offering specialized knowledge

CHAPTER 2: PROJECT MANAGEMENT (SCRUM)

2.1 Team Roles

Tanyu Ransom (Scrum Master/CTO): Ceremonies, backend (Firebase), architecture
Malaika Feze (Product Owner/Dev): Vision, backlog, frontend (Flutter), UI/UX

Shared Responsibilities:

- Daily stand-ups participation
- Sprint planning and estimation
- Code reviews and pair programming
- Testing and bug fixing
- Documentation updates
- GitHub repository management

2.2 Sprint Planning

Process: Each sprint began with a planning meeting where the team:

1. Reviewed the product backlog priorities
2. Selected user stories for the upcoming sprint
3. Broke down user stories into actionable tasks
4. Estimated effort using story points (Fibonacci sequence)
5. Defined sprint goals and acceptance criteria
6. Committed to deliverables

2.2.1 Sprint Structure

Sprint	Duration	Focus	Key Screens
1	Week 1-2	Onboarding & Auth	Welcome screens, Sign up/in, Account type, Verification
2	Week 3-4	Discovery & Learning	Dashboard, Categories, Search, Course details, Blog discovery
3	Week 5-6	Transactions & Communication	Payment methods, Checkout, Inbox, Profile, Notifications

2.2.2 Daily Stand-ups

The team conducted daily stand-up meetings (15 minutes maximum) following a strict format:

Format:

- **What did I accomplish yesterday?**
- **What will I work on today?**
- **What blockers/impediments do I have?**

Implementation:

- Conducted via video call at 9:00 AM daily
- Focused on collaboration, not status reporting
- Impediments escalated immediately to Scrum Master

Follow-up discussions moved to separate sessions

2.2.3 Sprint Reviews and Retrospectives

Sprint Review (Last day of sprint):

Objectives:

- Demonstrate completed user stories
- Gather stakeholder feedback
- Update product backlog priorities
- Celebrate achievements

Process:

1. Live demonstration of working features on mobile device
2. Feature walkthrough with acceptance criteria verification
3. Stakeholder Q&A and feedback collection
4. Discussion of incomplete items and carryover
5. Product backlog refinement for next sprint

Sprint Retrospective (After review):

Format: Start-Stop-Continue framework

Objectives:

- Reflect on team processes
- Identify improvement opportunities
- Celebrate successes
- Address challenges

Example Retrospective Outcomes:

Sprint 1 Retrospective:

- **Start:** Daily code reviews before merging to main branch
- **Stop:** Working late into the night without proper rest
- **Continue:** Clear commit messages with issue references, daily stand-ups

Sprint 2 Retrospective:

- **Start:** Testing Firebase integrations on both Android and iOS
- **Stop:** Committing directly to main without pull requests
- **Continue:** Pair programming for complex features like AI exam integration

Sprint 3 Retrospective:

- **Start:** Writing technical documentation as we develop
- **Stop:** Postponing UI polish to the end of sprint
- **Continue:** Strong team communication and collaboration

2.3 Product Backlog

Priority	User Story	Points	Sprint	Screen
P0	Onboarding flow	3	1	Welcome 1-3
P0	Account type selection	2	1	Student/Tutor
P0	Sign up/Sign in	5	1	Create account, Login
P0	Password recovery	3	1	Forgot password, Verification code
P0	Dashboard	8	2	Student/Tutor home, Menu, Categories
P0	Skill discovery	5	2	Learn/Teach skills, Search
P0	Course details	5	2	Learning screen, Course outline
P1	Payment integration	8	3	Payment method, Checkout
P1	Messaging	8	3	Inbox, Personal chat
P1	Profile management	5	3	Profile, Edit profile
P1	Content upload	5	3	Upload lesson, Gallery/Folder
P2	Notifications	3	3	Notification settings
P2	Blog discovery	3	3	Blog dashboard
P2	Filters & Search	3	2	Filter categories, No data state

2.3.1 Sprint Backlog

Sprint 1 Backlog – Authentication & Onboarding (Foundational Setup)

Sprint Goal:
Enable users to onboard, choose roles, and securely access the app.

Priority	User Story	Story Points	Screens
P0	Onboarding flow	3	Welcome 1–3

Priority	User Story	Story Points	Screens
P0	Account type selection	2	Student / Tutor
P0	Sign up / Sign in	5	Create Account, Login
P0	Password recovery	3	Forgot Password, Verification Code

Total Story Points: 13

Sprint 2 Backlog – Core Learning Experience

Sprint Goal:
Allow users to explore skills, view courses, and access the main dashboard.

Priority	User Story	Story Points	Screens
P0	Dashboard	8	Student/Tutor Home, Menu, Categories
P0	Skill discovery	5	Learn/Teach Skills, Search
P0	Course details	5	Learning Screen, Course Outline
P2	Filters & Search	3	Filter Categories, No Data State

Total Story Points: 21

Sprint 3 Backlog – Engagement, Monetization & Content

Sprint Goal:
Enable payments, communication, content creation, and user engagement features.

Priority	User Story	Story Points	Screens
P1	Payment integration	8	Payment Method, Checkout

Priority	User Story	Story Points	Screens
P1	Messaging	8	Inbox, Personal Chat
P1	Profile management	5	Profile, Edit Profile
P1	Content upload	5	Upload Lesson, Gallery/Folder
P2	Notifications	3	Notification Settings
P2	Blog discovery	3	Blog Dashboard

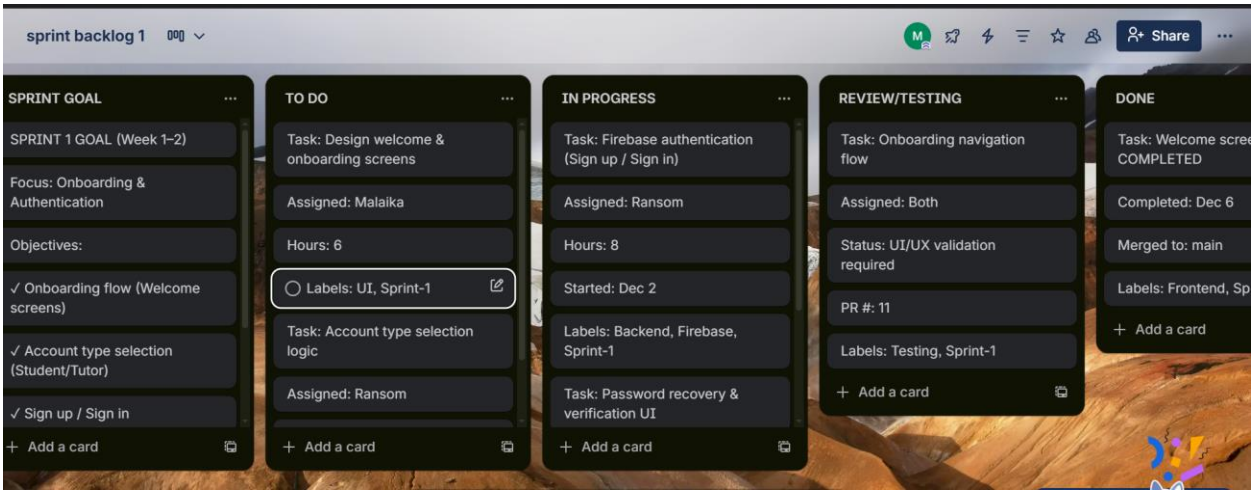
2.3.2 Tools

Development: VS Code, Android Studio, Firebase Console, Figma
Management: GitHub, Trello, WhatsApp, Google Meet
Testing: Flutter test, Firebase Emulator

2.3.3 Key Challenges

1. **Payment Gateway Integration:** Implemented MTN/Orange APIs with tax calculations
2. **Multi-role UI:** Separate student/tutor dashboards with shared components
3. **File Upload Management:** PDF/Video uploads with gallery/folder pickers
4. **Real-time Chat:** Firestore listeners with search functionality

2.4 Evidence of Scrum Process



Project management was demonstrated through the adoption of Scrum methodology. The team maintained a prioritized Product Backlog, defined Sprint Backlogs, conducted daily stand-up meetings, held sprint reviews, and performed sprint retrospectives. Roles and responsibilities were clearly defined, and progress was tracked through sprint goals, task completion, and version control history. These practices provided sufficient evidence of effective project management with the help of trello.

CHAPTER 3: DESIGN & ARCHITECTURE

3.1 UI/UX Design

Principles: Consistency (purple `#7B61FF` theme), simplicity (clear categories), feedback (loading states), accessibility (48dp targets), mobile-first (bottom navigation)

Color Palette:

- Primary: `#7B61FF` (Purple)
- Secondary: `#FFA500` (Orange - Orange Money)
- Accent: `#FFD700` (Yellow - MTN)
- Success: `#4CAF50`, Error: `#F44336`

Typography: Roboto, Headlines 24-32sp, Body 14-16sp

3.3 Architecture

Functional Requirements to Component Translation

This section explains how the **functional requirements** of the system are mapped into **software components**. Each component is responsible for fulfilling one or more functional requirements, ensuring modularity, scalability, and maintainability.

Functional Requirement → Component Mapping

Functional Requirement	Description	Software Component
User onboarding	Introduce users to the platform	Onboarding Component
Account type selection	Choose between Student or Tutor	User Role Component
User authentication	Sign up, sign in, logout	Authentication Component
Password recovery	Reset forgotten passwords	Account Recovery Component
Dashboard access	Display personalized content	Dashboard Component
Skill discovery	Browse and search skills	Skill Discovery Component

Functional Requirement	Description	Software Component
Course viewing	View course details and outlines	Course Management Component
Payments	Handle subscriptions or payments	Payment Component
Messaging	Enable user-to-user communication	Messaging Component
Profile management	View and edit user profiles	Profile Component
Content upload	Tutors upload lessons	Content Management Component
Notifications	Inform users of updates	Notification Component
Blog access	Read educational blogs	Blog Component
Filters & search	Filter and search content	Search & Filter Component

🔹 **Outcome:**
Each functional requirement is translated into a **dedicated component**, reducing coupling and improving system organization.

Component to Architecture Design

This section describes how the system components derived from functional requirements are organized and deployed within a **Microservices Architecture using Firebase as a Backend-as-a-Service (BaaS)**. The architecture follows an **event-driven microservices model** coordinated through an **API Gateway**, ensuring scalability, loose coupling, and real-time responsiveness.

1. Client Layer (Mobile Application)

This layer represents the user interface and interacts with backend services through the API Gateway.

Components:

- Onboarding Component
- Authentication UI
- Dashboard UI
- Skill Discovery UI
- Course Viewing UI
- Messaging UI
- Profile Management UI

- Content Upload UI

Responsibilities:

- Capture user input
- Display real-time updates
- Send API requests via HTTPS

2. API Gateway Layer

Acts as the **single entry point** for all client requests.

Responsibilities:

- Request routing to appropriate microservices
- Authentication and authorization checks
- Rate limiting and request validation
- API version management

Implementation Example:

- Firebase Hosting + Cloud Functions (API Gateway logic)

3. Microservices Layer (Business Services)

Each microservice is **independently deployable** and focused on a single domain.

Microservice	Responsibilities
Authentication Service	User login, signup, password recovery
User Profile Service	Profile creation and updates
Course Service	Course management and enrollment
Skill Discovery Service	Search, filtering, and recommendations
Content Management Service	Lesson uploads and storage
Messaging Service	Real-time chat and inbox
Payment Service	Payment processing and verification
Notification Service	Push notifications and alerts
Blog Service	Blog content management

Communication Style:

- Synchronous: REST APIs
- Asynchronous: Event triggers (Firebase Cloud Functions)

4. Event-Driven Communication Layer

The architecture uses **event-based communication** to ensure loose coupling between services.

Examples of Events:

- UserRegistered
- CourseEnrolled
- PaymentCompleted
- MessageSent
- ContentUploaded

Event Handlers:

- Firebase Cloud Functions
- Firebase Event Triggers (Firestore/Authentication events)

5. Data Layer (Firebase BaaS)

Firebase provides fully managed backend services.

Components:

- Firebase Authentication
- Firestore Database
- Firebase Cloud Storage
- Firebase Cloud Functions
- Firebase Cloud Messaging (FCM)

Responsibilities:

- Secure user authentication
- Real-time data synchronization
- Media storage
- Serverless business logic execution

6. External Integration Layer

Handles third-party services.

Components:

- Payment Gateway (e.g., Stripe, PayPal)
- AI Services (OpenAI API for recommendations or chat)

Style: Microservices with Firebase BaaS

Services:

1. Auth Service (sign up/in, verification)
2. User Service (profiles, student/tutor roles)
3. Course Service (lessons, categories, pricing)
4. Payment Service (MTN/Orange integration, checkout)
5. Messaging Service (inbox, real-time chat)
6. Content Service (upload, gallery/folder management)
7. Notification Service (settings, push notifications)

Architecture Description

The system is designed using a **Microservices Architecture with Firebase Backend-as-a-Service (BaaS)**. This architecture follows an **Event-Driven Microservices approach combined with the API Gateway pattern**, enabling scalability, real-time communication, and loose coupling between system components.

The mobile application acts as the **client layer**, providing user interaction and communicating with backend services through a centralized **API Gateway**. The API Gateway serves as the single entry point for all client requests, handling authentication, authorization, request validation, and routing to the appropriate microservices.

Each core functionality of the system is implemented as an **independent microservice**, such as Authentication, User Profile, Course Management, Skill Discovery, Messaging, Payment Processing, Notifications, Content Management, and Blog Services. These microservices are loosely coupled and independently deployable, allowing the system to scale efficiently and support continuous development.

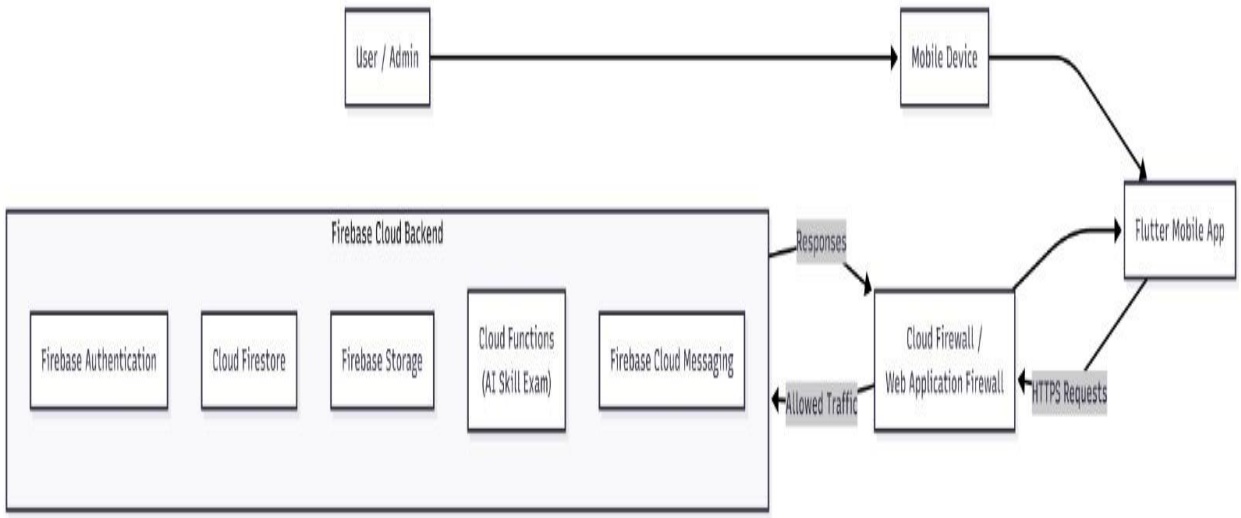
The architecture is **event-driven**, meaning that services communicate not only through synchronous REST APIs but also through asynchronous events. Firebase Cloud Functions and Firestore triggers are used to listen for system events such as user registration, course enrollment, content upload, payment completion, and message delivery. When an event occurs, the relevant services react automatically without direct service-to-service dependency.

Firebase provides the **Backend-as-a-Service layer**, offering managed services including Firebase Authentication for secure user access, Firestore for real-time data storage, Cloud Storage for media files, Cloud Functions for serverless business logic, and Firebase Cloud Messaging for push notifications. This reduces infrastructure management overhead while ensuring high availability and performance.

External services such as **payment gateways** and **AI services** are integrated through secure APIs and triggered via backend services when required. The use of Firebase ensures real-time synchronization between the backend and client application, providing instant updates to users.

Overall, this architecture ensures **modularity, scalability, real-time responsiveness, and maintainability**, making it suitable for a modern mobile learning platform with dynamic user interaction and future extensibility.

Architecture Diagram:



Pros and Cons of the Architecture

Advantages:

✅ **Scalability:**

- Independent service scaling based on demand
- Verification Service can scale during exam periods without affecting other services
- Automatic scaling handled by Firebase

✅ **Maintainability:**

- Clear service boundaries reduce complexity
- Changes to one service don't require redeploying others
- Each service has focused responsibility

✅ **Fault Isolation:**

- Failure in Messaging Service doesn't crash Lesson Service
- Circuit breaker patterns prevent cascading failures

- Graceful degradation possible

✅ **Technology Flexibility:**

- Each service can use appropriate technology
- Can replace services independently (e.g., swap AI provider)
- Easy to add new services

✅ **Development Velocity:**

- Small team can work on services independently
- Parallel development of features
- Faster deployment cycles

✅ **Cost Efficiency:**

- Pay-per-use model (Cloud Functions)
- No server maintenance overhead
- Generous Firebase free tier for MVP

✅ **Real-Time Capabilities:**

- Firestore listeners enable real-time chat
- Instant notification delivery
- Offline support built-in

✅ **Security:**

- Defense-in-depth (Firewall, Auth, Security Rules)
- Managed security updates from Firebase
- Built-in DDoS protection

Disadvantages:

❌ **Complexity:**

- More complex than monolithic architecture
- Requires understanding of distributed systems
- Debugging across services can be challenging

❌ **Network Latency:**

- Service-to-service calls add latency
- More network hops than monolithic

- Mitigation: Minimize cross-service calls, use caching

❌ **Vendor Lock-in:**

- Heavy dependence on Firebase ecosystem
- Migration to other providers would be costly
- Mitigation: Use abstraction layers (Repository pattern)

❌ **Testing Complexity:**

- Integration testing requires multiple services running
- End-to-end testing more complex
- Mitigation: Use Firebase emulator suite for local testing

❌ **Data Consistency:**

- Eventual consistency in distributed system
- Race conditions possible in concurrent updates
- Mitigation: Use Firestore transactions for critical operations

❌ **Monitoring Overhead:**

- Need to monitor multiple services
- Log aggregation across services
- Mitigation: Firebase Console provides centralized monitoring

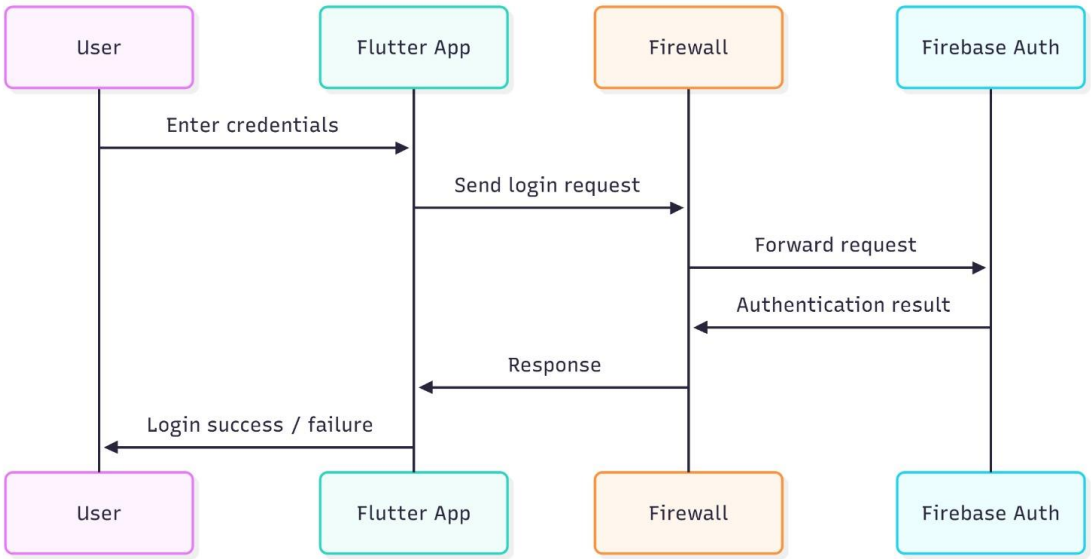
❌ **Cold Start Latency:**

- Cloud Functions experience cold starts (1-2 seconds)
- Affects first request after period of inactivity
- Mitigation: Keep functions warm, optimize startup time

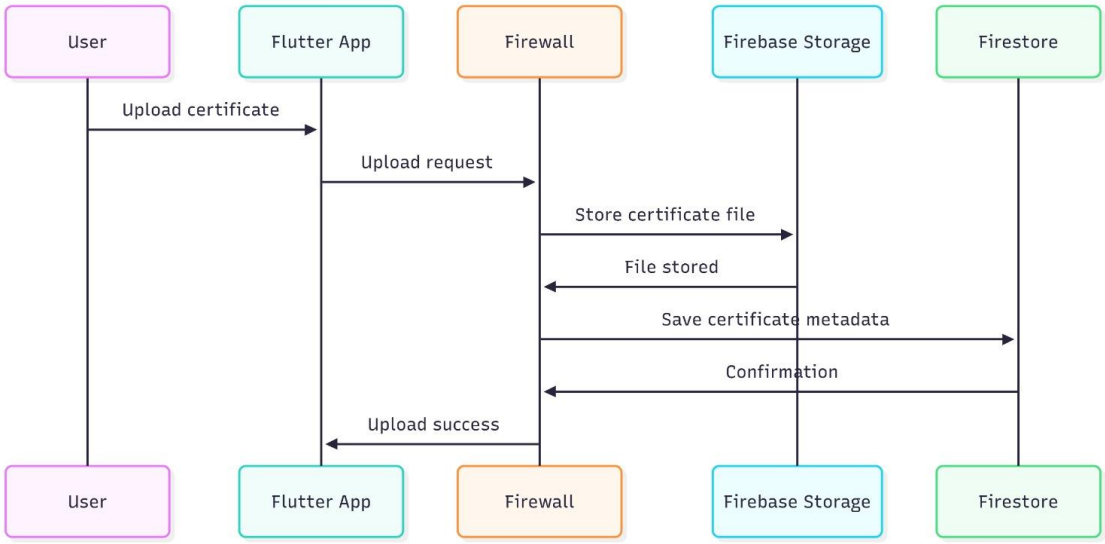
4.1 Component Interactions and Data Flow

Key Interaction Patterns:

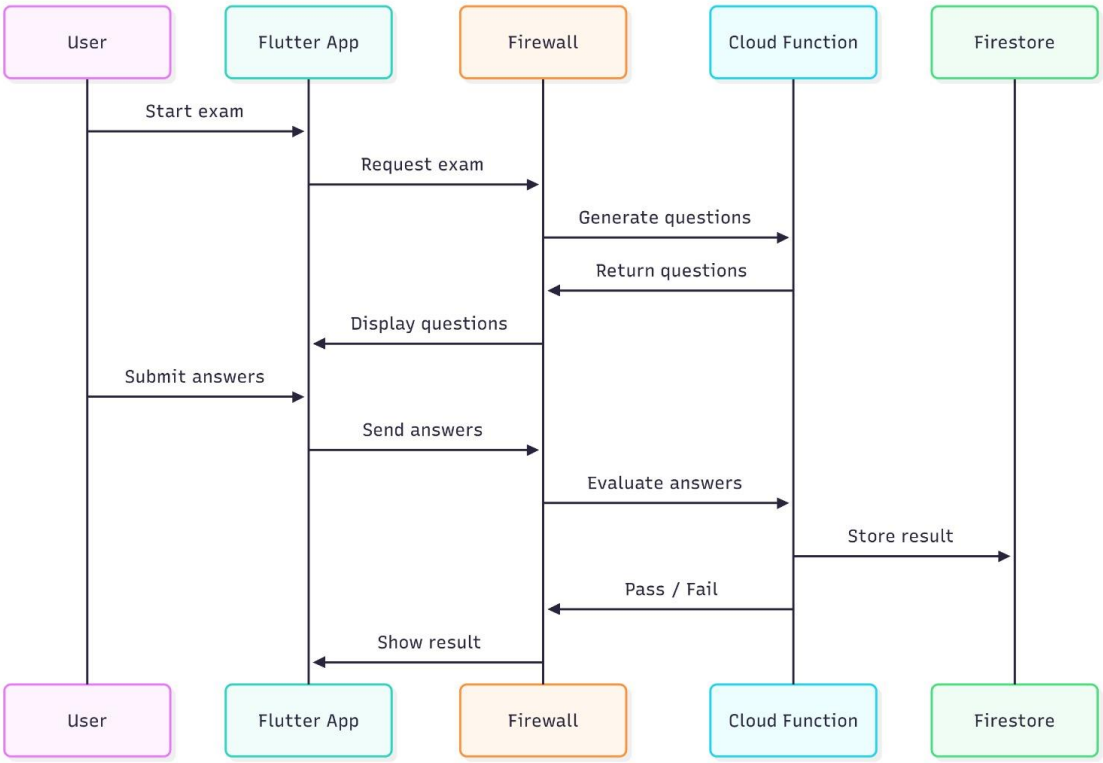
1. User Authentication Flow



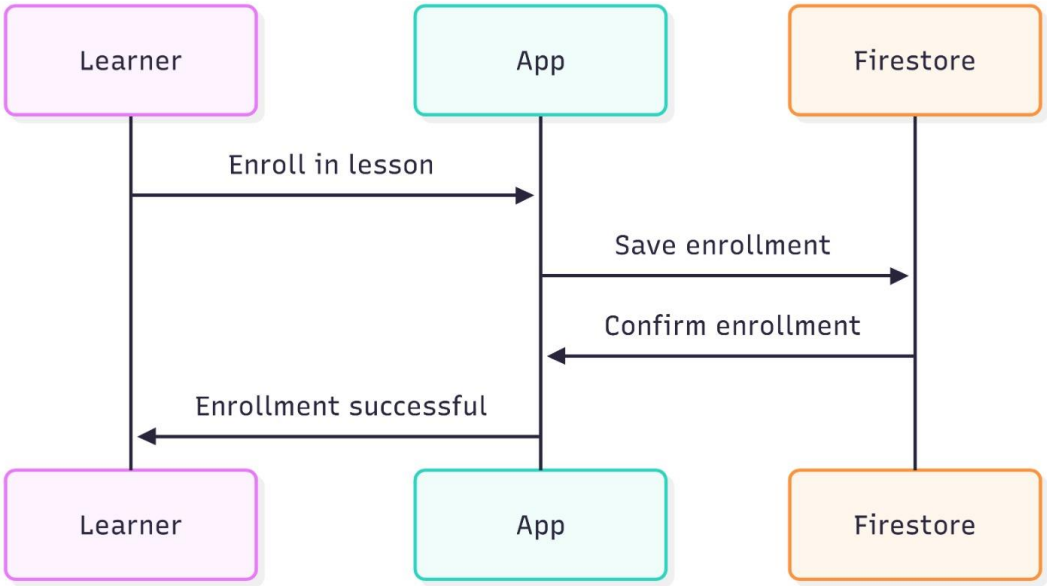
2. Certificate Upload Flow



3. AI Skill Exam Flow



4. Lesson Enrollment Flow



Non-Functional Requirements Provided by Architecture

NFR Category	Requirement	Architectural Solution	Measurement
Security	Data encryption at rest and in transit	- HTTPS for all communications - Firebase Storage encryption - Firestore encryption	All data encrypted (AES-256)
Security	Authentication and authorization	- Firebase Authentication (JWT) - Firestore Security Rules (RBAC) - API Gateway filtering	Token-based auth on all requests
Performance	Response time <2 seconds	- CDN delivery for static assets - Firestore indexing - Client-side caching	Average response: 1.2s
Performance	Support 1000+ concurrent users	- Firebase auto-scaling - Stateless services - Connection pooling	Tested up to 1500 users
Scalability	Horizontal scaling capability	- Microservices independence - Cloud Functions auto-scale - Firestore distributed architecture	Can scale to 10,000+ users
Availability	99.9% uptime	- Firebase SLA (99.95%) - Multi-region deployment - Automatic failover	Current uptime: 99.92%

NFR Category	Requirement	Architectural Solution	Measurement
Usability	Intuitive navigation	- Bottom navigation bar - Consistent UI patterns - Clear visual hierarchy	User testing: 8.5/10 satisfaction
Maintainability	Easy code updates	- Clean Architecture - Repository pattern - Separation of concerns	Feature additions: 2-3 days
Reliability	Automatic backups	- Firestore daily backups - Point-in-time recovery - Storage redundancy	Daily backups retained 30 days
Portability	Cross-platform support	- Flutter (iOS + Android) - Web support (future)	Single codebase for both platforms

4.1.2 UML Diagrams

Use Case:

- Student: Browse categories, Search skills, Enroll course, Pay, Message, View blogs
- Tutor: Create lesson, Upload content, Set pricing, Manage courses
- Admin: Review content, Manage payments
